Helical Gear Design

The speed reduction mechanism employs helical gears, which provides two times meshing rate of teeth when comparing with regular spur gears. In addition, it also features extremely smooth running, low noise, high torque output and low backlash.

Synthetic Lubrication Grease

The protective class IP65 seals design avoids leakage problem. It features no maintenance.

Collet Locking Mechanism

The input-end and the motor are coupled through a collet locking mechanism. It has passed dynamical balance analysis to assure concentricity and balance on the connection and no backlash for power transmission while running at high speed.

Quality First & Customers Satisfaction

Full Needle Roller Bearings Design

The planetary gear transmission employs full needle roller bearings without retainer to increase the contact surface, which greatly upgrades structural rigidity and service life.

Integrated Planetary Arm Bracket

The planetary arm bracket and the output shaft are one-piece constructed to increase torsional rigidity and accuracy. The entire structure is one-time machined for controlling accuracy in the specified tolerance.

High Precision Gear Machining

The planetary gear and sun gear are made by high quality Ni-Cr-Mo alloy steel (SNCM220), precision machined and carburized to hardness 57-60 HRC. Precision teeth grinding assures gear accuracy reaches DIN6 class. It provides better wear resistance, impact resistance and longer service life than gears with only surface nitrided.

One-piece Gear Box & Advanced Surface Treatment

The gear box and internal gear ring are one-piece constructed, which is made by Cr-Mo alloy steel (SCM440), and tempered for high torque output. High gear accuracy meets DIN6 class standard. Gearbox surface is anti-corrosive treated for upgrading environmental-resistant and corrosion-resistant capability.

CAE Design and Analysis

Employs 3D-CAE software for analysis and design, the software allows for analyzing the strength of the entire gear reducer and modifying the helical teeth profile and lead. This reduces the impact and noise during teeth engage and disengage, while increasing the service life of gears and the gear reducer.

Modular Design of Motor Connection Plate

The special modular design of motor connection plate is suitable for any brand and any type of servomotor. It is made by aluminum alloy. Its surface is anti-oxidant treated for upgrading environmental-resistant and corrosion-resistant capability.

SERVOBOX

Planetary Reducers

SERVOBOX series high precision planetary gear reducer employs helical gears. All gears are high precision machined by CNC gear hobbing machine, providing high accuracy gear engagement, smooth running and minimum noise.

LIMING gear box is one-piece fabricated. When comparing with the competitive gear reducer, LIMING gear reducer features smaller construction (saves over 1/4 of size and weight), higher output torque and higher transmission efficiency.

Characteristic of SERVOBOX Series

SERVOBOX

Low Noise

Under 65dB.

Low Backlash

Backlash for 1-stage model is under 7 arcmin. Available to select specification with 1 arcmin of backlash. Backlash for 2-stage model is under 9 arcmin.

High Efficiency

Efficiency for 1-stage model exceeds 97%; 2-stage model exceeds 94%.

High Input Speed

Input speed allows for 5,000 RPM.

High Torque

Higher output torque is in comparison with spur gear planetary gear reducers.

High Stability

Employs high tensile strength alloy steel. Gear hardening is made for the entire gear instead of only surface hardening, which extends gear service life and maintain high accuracy after a long period of operation.

High Speed Reduction Ratio

The gear reducer is a modular design. The planetary gear box can be connected. Speed reduction ratio can reach over than 1/10000.

Description of Standard and A-Type

The features of 2-stage or 3-stage gearbox are high gear ratio and large output torque. The standard type of 2-stage or 3-stage gearbox are combined by big and small gearboxes to have a limit to input power and then to meet rated output torque. A-Type has a combination of 2 gearboxes with same frame.

Standard

A-Type

Example:

Servo motor 0.5 kW, rated output torque 2.39 Nm,
motor shaft Ø24 mm.

1. Suppose the speed reduction ratio is 1/50:

Output torque is 2.39 Nm x 50 x 94% (efficiency) = 112 Nm.

- You can select SB-120-50 with rated output torque of 294 Nm and S.F. = 2.6
- You can select SB-90A-50 with rated output torque of 141 Nm and S.F. = 1.25

2. Suppose the speed reduction ratio is 1/100:

Output torque is 2.39 x 100 x 94% (efficiency) = 224 Nm.

You can select SB-120-100 and S.F. = 1.3. You are not suggested to choose SB-90A-100 because of low S.F. = 0.62.

The table is for reference. The selected model shall be based on rated output torque.

Glossary

Gear Ratio (i)

The gear ratio i indicates the factor by which the gearhead transforms the three relevant parameters of motion (speed, torque and mass moment of inertia). The factor is a result of the geometry of the gearing elements (Example: $i = 10$).

$$\begin{array}{l} n_1 = 3000 \text{ rpm} \xrightarrow{\quad : i \quad} n_2 = 300 \text{ rpm} \\ T_1 = 20 \text{ Nm} \xrightarrow{\quad \cdot i \quad} T_2 = 200 \text{ Nm} \\ J_2 = 10 \text{ kgm}^2 \xrightarrow{\quad : i^2 \quad} J_1 = 0.10 \text{ kgm}^2 \end{array}$$

Input Speed (n_1) [rpm]

Input Speed is same as motor speed, if the motor direct connected gearbox.

Output Speed (n_2) [rpm]

The output speed is calculated by the formula related to input speed n_1 and reduction ratio i .

$$n_2 = \frac{n_1}{i}$$

Nominal Input Speed (n_{1N}) [rpm]

Input speed of gearbox shall be less than nominal input speed in the model of continuous operation (S1). Nominal input speed (n_{1N}) is measured at environment temperature 20° C. If the environment temperature is higher or the temperature of gearbox surface exceeds 90° C, please lower input speed (n_1).

Glossary

Max Input Speed (n_{1B}) [rpm]

It is applied to cyclic operation (S5). Max. input speed is measured at environment temperature 20° C. If the environment temperature is higher or the temperature of gearbox surface exceeds 90° C, please lower input speed (n_1).

Speed (n) [rpm]

Two speeds are of relevance when selecting a gearbox: the maximum speed and the nominal speed at the input. The maximum permissible speed n_{1B} must not be exceeded because it serves as the basis at cyclic operation. The nominal speed n_{1N} must not be exceeded at continuous operation. The housing temperature limits the nominal speed, which must not exceed 90° C. The nominal input speed specified in the catalogue applies to an ambient temperature of 20° C. As can be seen in the diagram below, the temperature limit is reached more quickly in the presence of an elevated outside temperature. In other words, the nominal input speed must be reduced if the ambient temperature is high. The values applicable to your gearbox are available from LIMING on request.

Glossary

Nominal torque (Rated Output Torque) (T_{2N}) [Nm]

The nominal torque T_{2N} is the torque continuously transmitted by a gearbox during a long period of time, i.e. in continuous operation (without wear).

CAE

AE Analysis

Emergency Stop Torque (Max. Output Torque) (T_{2NOT}) [Nm]

The emergency stop torque T_{2NOT} is the maximum permissible torque at the gearbox output end and must not be reached more than 1000 times during the service life of the gearbox. It must never be exceeded to prevent inside parts from damage. LIMING SERVOBOX $T_{2NOT} = 3 \cdot T_{2B}$ (3 times of rated output torque)

Acceleration Torque (T_{2B}) [Nm]

The acceleration torque T_{2B} is the maximum permissible torque that can briefly be transmitted at the gearbox output end under the duty cycle $< 1000/h$ cycles. For $> 1000/h$ cycles, the impact factor must be taken into account. T_{2B} is the max. parameter in cyclic operation. Application acceleration torque (T_{2b}) shall be smaller than T_{2B} ; otherwise the gearbox service life will be reduced.

No Load Running Torque (T_{012}) [Nm]

The no load running torque is the torque which must be applied to a gearbox in order to overcome the internal friction; it is therefore considered lost torque.

Back Driving Torque [Nm]

The back driving torque is the minimum torque to start the rotation from the output side of gearbox. A larger size or a higher ratio gearbox requires greater back driving torque.

Glossary

Average Service Life [h]

Average service life is the working time of gearbox running at rated loading and nominal input speed at cyclic operation.

The service life is not a guarantee of the actual service life of the gear reducer. It is an average calculated life derived from industry formulas (*), and other factors such as running test results, CAE (Computer Aided Engineering) software and so on. These factors take into consideration the metal composition, heat treatment, the design of the gearing and bearings, as well as calculated loads. Service life calculations are not based on actual field conditions or applications, and do not represent a guarantee with respect to expected life, performance, or other characteristics of gear reducer in any given application or use. The actual service life could vary substantially from the nominal service life.

*: Industry formula Refer to the following standardization organization
GB/T 3480-1997 , ISO 6336-1~6336-3:1996

ISO: International Organization for Standardization
GB: Guobiao standards (Chinese National Standards)
DIN: Deutsches Institut für Normung : (German Institute for Standardization)
AGMA: American Gear Manufacturers Association
JIS: Japanese Standards Association

Axial Force (F_{2A}) [N]

The axial force F_{2A} acting on a gearbox runs parallel to its output shaft. The force runs perpendicular to its output shaft. It may be applied with axial offset via a lever arm y_2 under certain circumstances, in which case it also generates a bending moment. If the axial force exceeds the permissible catalogue values, additional design features (e.g. couplings) must be implemented to absorb these forces.

Glossary

Radial Force (F_{2R}) [N]

The radial force is the force acting at right angles to axial force. It acts perpendicular to the axial force and can assume an axial distance of (d) in relation to the shaft end, which acts as a lever arm. The radial force produces a bending moment.

The gearbox will bear radial force while its output shaft connected with transmission machinery, such as chain pulley. The O.H.L. formula of radial force is as below :

$$OHL = \frac{T \cdot s \cdot f \cdot p}{R}$$

T = Torque of transmission machinery

s = Service factor

f = Driven Coefficient

R = Radius of pulley or chain wheel

p = Position Factor: loading position less than d , $p=1$

loading position larger than d , $p=1.5$

(s) Service factor table

| Loading classification | Running per Day | | | |
|------------------------|-----------------|------|---------|----------|
| | 0.50 hr | 2 hr | 8-10 hr | 10-24 hr |
| Uniform | 0.80 | 0.90 | 1.00 | 1.25 |
| Medium shock | 0.90 | 1.00 | 1.25 | 1.50 |
| Heavy shock | 1.00 | 1.25 | 1.50 | 1.75 |

Driven Coefficient (f)

| Driving mode | (f) |
|--------------|------|
| Chain pulley | 1.00 |
| Gear | 1.25 |
| V-belt | 1.50 |
| Flat-belt | 2.50 |

- CW/CCW operation or start-up/stop reaches 10 times or more within 1 hour, please multiply by 1.2.

Glossary

Permitted Radial Force (F_{2rB}) [N]

The maximum allowed radial force in the 1/2 position of output shaft in the condition of output speed 100 RPM. This value is decreasing when the running speed is increasing.

Permitted Axial Force (F_{2aB}) [N]

The maximum allowed axial force in the condition of output speed 100 RPM.

Transmission efficiency η [%]

Efficiency (η) is the ratio of output power to input power. Power lost through friction reduces efficiency to less than 1 or 100%.

$$\eta = \frac{P_{out}}{P_{in}} = \frac{P_{in} - P_{lost}}{P_{in}}$$

Glossary

Noise Level [dB]

The operating noise specified in our catalog relates to gearboxes with the ratio $i=10$ or $i=100$ (2 stage) at input speed 3,000 rpm and no loading running. Noise level is measured at 1M distance from the gearbox. Higher speed results to higher noise level; higher loading results to higher noise level.

Mass moment of inertia (J) [Kg.cm²]

The mass moment of inertia J is a measurement of the effort applied by an object to maintain its momentary condition (at rest or moving).

Rate of mass moment of inertia (λ)

The ratio of mass moment of inertia λ is the ratio of external inertia (application side) to internal inertia (motor and gearbox). It is an important parameter determining the controllability of an application. Accurate control of dynamic processes becomes more difficult with differing mass moments of inertia and as λ becomes greater. LIMING recommends that a guideline value of $\lambda < 5$ is maintained. A gearbox reduces the external mass moment of inertia by a factor of $1 / i^2$.

Simple applications ≤ 10

Dynamic applications ≤ 5

Highly dynamic applications ≤ 1

Torsional Backlash (j_t) [arcmin]

Torsional backlash j_t is the maximum angle of torsion of the output shaft in relation to the input. Torsional backlash is measured with the input shaft locked. The output is then loaded with a defined test torque (2% rated output torque) in order to overcome the internal gearhead friction. The main factor affecting torsional backlash is the face clearance between the gear teeth.

Glossary

Angular minute [Arcmin]

A degree is subdivided into 60 angular minutes (= 60 arcmin = 60'). In other words, if the torsional backlash is specified as 1 arcmin, for example, the output can be turned $1/60^\circ$. The repercussions for the actual application are determined by the arc length.

EX: A pinion with a radius $r = 500$ mm on a gearhead with standard torsional backlash $j_t = 3'$ can be turned $b = 0.44$ mm.

$$b = \frac{2 \cdot \pi \cdot r \cdot j_t}{21600}$$

Hysteresis Curve

The hysteresis is measured to determine the torsional rigidity of a gearbox. The result of this measurement is known as the hysteresis curve. If the input shaft is locked, the gearhead is loaded with a torque that increases continuously up to T_{2B} and is then relieved at the output in both directions. The torsional angle is plotted against the torque. This yields a closed curve from which the torsional backlash and torsional rigidity can be calculated.

$$C_{t21} = \frac{\Delta T}{\Delta \phi}$$

Glossary

Torsional rigidity (C_{t21}) [Nm/Arcmin]

Torsional rigidity is defined as the quotient of applied torque and generated torsion angle.

$$C_{t21} = \frac{\Delta T}{\Delta \phi}$$

It consequently shows the torque required to turn the output shaft by one angular minute. The torsional rigidity can be determined from the hysteresis curve. Only the area between 50% and 100% of T_{2B} is considered because this area of the curve profile can be considered linear.

Operating modes

(continuous operation S1 and cyclic operation S5)

When selecting a gearbox, it is important to consider whether the motion profile is characterized by frequent acceleration and deceleration phases in cyclic operation (S5) as well as pauses, or whether it is designed for continuous operation (S1), i.e. with long phases of constant motion.

Continuous operation (S1)

Continuous operation is defined by the duty cycle. If the duty cycle is greater than 60% or longer than 20 minutes, this qualifies as continuous operation.

Cyclic operation (S5)

Cyclic operation is defined by the duty cycle. If the duty cycle is less than 60% and shorter than 20 minutes, it qualified as cyclic operation.

Glossary

Duty cycle (ED)

The duty cycle ED is determined by one cycle. The times for acceleration (t_a), constant travel if applicable (t_c) and deceleration (t_d) combined yield the duty cycle in minutes. The duty cycle is expressed as a percentage with inclusion of the pause time t_p .

$$ED = \frac{t_a + t_c + t_d}{t_{cycle}}, t_{work} = t_a + t_c + t_d$$

t_a Acceleration , t_c Constant ,

t_d Deceleration , t_p Pause

Stage

The sun gear and planetary gear forms an independent speed reduction gear system. If there is only one gear system in the gear reducer, it is defined as one stage transmission. In order to achieve higher speed reduction ratio, multiple stages transmission is required. LIMING's standard gear reducers are classified into one stage and two-stage transmission. Speed reduction ratio range is from 3 to 100. The modular construction combined with multiple stages transmission allows speed reduction ratio 100~100,000 and over.

Glossary

Degree of protection (IP)

The protective class IP65 sealed design avoids leakage problem.

The various degrees of protection are defined in IEC 60529 "Degrees of protection offered by enclosure (IP code)". The IP degree of protection (IP stands for International Protection) is represented by two digits. The first digit indicates the protection against the ingress of impurities and the second the protection against the ingress of water.

● IP65 Test Report by Metal Industries & Development Center.

| Protection against contact and against solid foreign objects. | | Protection against ingress of water. | |
|---|--|--------------------------------------|--|
| 1st numeral | Description | 2nd numeral | Description |
| 0 | Non-protected | 0 | Non-protected |
| 1 | Protected against solid foreign objects of >50mm \varnothing | 1 | Protected against vertically falling water drops |
| 2 | Protected against solid foreign objects of >12.5mm \varnothing | 2 | Protected against vertically falling water drops when enclosure tilted up to 15° |
| 3 | Protected against solid foreign objects of >2.5mm \varnothing | 3 | Protected against spraying water when enclosure tilted up to 60° |
| 4 | Protected against solid foreign objects of >1.0mm \varnothing | 4 | Protected against splashing water |
| 5 | Protected against ingress of dust (dust-protected) | 5 | Protected against water jets |
| 6 | Protected against ingress of dust by underpressure (dust-tight) | 6 | Protected against powerful water jets |
| | | 7 | Protected against the effects of temporary immersion in water |
| | | 8 | Protected against the effects of continuous immersion in water |

Glossary

Operating Temperature

The Operating Temperature indicates the allowable temperature of gearbox at continuous and cyclic operation. SERVOBOX series work in $-25^{\circ}\text{C} \sim +90^{\circ}\text{C}$.

Consider working temperature, ambient temperature should be in $-25^{\circ}\text{C} \sim +45^{\circ}\text{C}$.

Lubrication

It's no essential to replace lubricant during the service life. Lubrication of standard products uses synthetic grease (0#). It depends on the application, there are other grease available.

Collet Clamping

The Collet Clamping ensure a frictional between motor shaft and gearbox. It has passed dynamical balance analysis to assure concentricity and no backlash at high input speed operation.

Bushing

If the motor shaft diameter is smaller than the input bore of gearbox, a bushing is used to compensate the difference in diameter.

Glossary

Design of connecting plate

Design of connecting plate is suitable for various servo motors or others, and also easy for installation. General dimension is shown on the catalogue. Please find other dimensions from our website.

| 參數值 Value | 單位 Unit |
|-------------------|------------------------|
| 輸出功率 Output Power | 0.5 W |
| 額定力矩 Rated Torque | 1.39 NM |
| 最大力矩 Max. Torque | 4.77 NM |
| 額定轉速 Rated Speed | 3000 RPM |
| 最大轉速 Max. Speed | 3000 RPM |
| 轉動慣量 Inertia | 6.8 kg/cm ² |
| 軸徑 Shaft Dia. | 24 mm |
| 外徑 Diameter | 130 mm |
| 凸緣 | 110 mm |
| PCD | 145 mm |

Recommended (for S5 Cyclic Operation)

The general design is given for

$$\frac{J_L}{i^2} \leq 4 \cdot J_m$$

The optimal design is given for

$$\frac{J_L}{i^2} \cong J_m$$

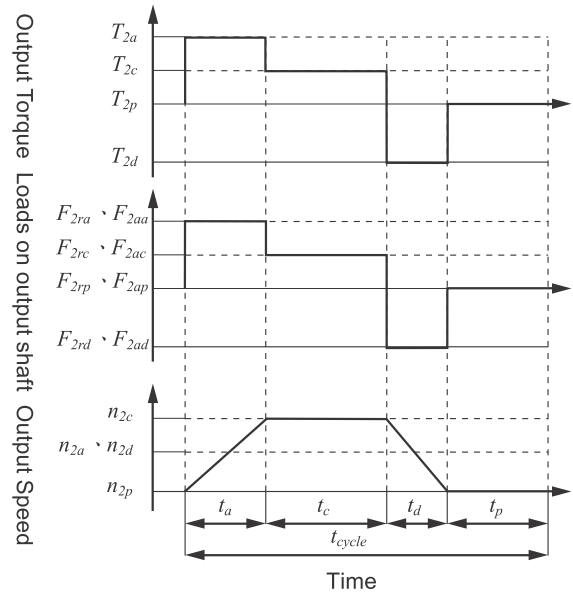

Where J_L is Load Inertia and J_m is Motor Inertia.

T_{2N} please reference catalog 「Rated Output Torque」

F_{2rB} please reference catalog 「Max. Radial Force」

$$\text{Eq.1} \quad i \cong \frac{n_m}{n_{\text{work}}}$$

n_m is output speed of the motor, n_{work} is working speed

$$\text{Eq.2} \quad T_{2m} = \sqrt[3]{\frac{n_{2a} \cdot t_a \cdot T_{2a}^3 + n_{2c} \cdot t_c \cdot T_{2c}^3 + n_{2d} \cdot t_d \cdot T_{2d}^3}{n_{2a} \cdot t_a + n_{2c} \cdot t_c + n_{2d} \cdot t_d}}$$

$$\text{Eq.3} \quad ED = \frac{t_a + t_c + t_d}{t_{\text{cycle}}}, t_{\text{work}} = t_a + t_c + t_d$$

t_a is the time for acceleration, t_c is constant travel,
 t_d is the time for deceleration and t_p is the time for pause.

$$\text{Eq.4} \quad T_{2\text{max}} = T_{mB} \cdot i \cdot k_s \cdot \eta$$

T_{mB} is the Max. output torque of the motor and η is the efficiency of the gearbox

| K_s service factor | |
|----------------------|--------------------|
| K_s | No. of Cycles / hr |
| 1.0 | 0 ~ 1,000 |
| 1.1 | 1,000 ~ 1,500 |
| 1.3 | 1,500 ~ 2,000 |
| 1.6 | 2,000 ~ 3,000 |
| 1.8 | 3,000 ~ 5,000 |

$$\text{Eq.5} \quad n_{2a} = n_{2d} = \frac{n_{2c}}{2}$$

$$n_{2m} = \frac{n_{2a} \cdot t_a + n_{2c} \cdot t_c + n_{2d} \cdot t_d}{t_a + t_c + t_d}$$

$$n_{2N} = \frac{n_{1N}}{i}$$

$$\text{Eq.6} \quad F_{2rm} = \sqrt[3]{\frac{n_{2a} \cdot t_a \cdot F_{2ra}^3 + n_{2c} \cdot t_c \cdot F_{2rc}^3 + n_{2d} \cdot t_d \cdot F_{2rd}^3}{n_{2a} \cdot t_a + n_{2c} \cdot t_c + n_{2d} \cdot t_d}}$$

$$\text{Eq.7} \quad F_{2am} = \sqrt[3]{\frac{n_{2a} \cdot t_a \cdot F_{2aa}^3 + n_{2c} \cdot t_c \cdot F_{2ac}^3 + n_{2d} \cdot t_d \cdot F_{2ad}^3}{n_{2a} \cdot t_a + n_{2c} \cdot t_c + n_{2d} \cdot t_d}}$$

Installation & Critical Applications

Critical applications

For other mounting positions and/or particular input speeds, please contact our technical person.

It is also necessary to take due consideration of and carefully assess the following applications by calling our Technical Service:

- The maximum input speed exceeds nominal input speed.
- The maximum output torque exceeds rated output torque.
- Use in services that could be hazardous for people if the reduction unit fails.
- Applications with especially high inertia.
- Use as a lifting winch.
- Applications with high dynamic strain on the case of the reduction unit.
- Ambient temperature under -25°C or over 45°C .
- Use in chemically aggressive environments.
- Use in a salty environment.
- Use in radioactive environments.
- Use in environments pressures other than atmospheric pressure.

Avoid applications where even partial immersion of the reduction unit is required.

The maximum torque (*) that the gear reducer can support must not exceed three times the nominal torque .

(*) intended for momentary overloads due to starting at full load, braking, shocks or other causes, particularly those that are dynamic.

Installation & Critical Applications

Installation

To install the reduction unit, it is necessary to note the following recommendations:

- The mounting on the machine must be stable to avoid any vibration.
- Check the correct direction of rotation of the reduction unit output shaft before fitting the unit to the machine.
- In the case of particularly lengthy periods of storage (4/6 months), if the oil seal is not immersed in the lubricant inside the unit, it is recommended to change it since the rubber could stick to the shaft or may even have lost the elasticity it needs to function properly.
- Whenever possible, protect the reduction unit against solar radiation and bad weather.
- Ensure the motor cools correctly by assuring good passage of air from the fan side.
- In the case of ambient temperatures $< -25^{\circ} \text{C}$ or $> +45^{\circ} \text{C}$ call the Technical Services.
- The various parts (pulleys, gear wheels, couplings, shafts, etc.) must be mounted on the solid or hollow shafts using special threaded holes or other systems that anyhow ensure correct operation without risking damage to the bearings or external parts of the units. Lubricate the surfaces in contact to avoid seizure or oxidation.
- Starting must take place gradually, without immediately applying the maximum load.
- When there are parts, objects or materials under the motor drive that can be damaged by even limited spillage of oil, special protection should be fitted.

Applications

○ Linear Action

● Ball Screw

● Rack

● Roller / Belt

Planetary Gearbox and Motor Mounting Instructions

Confirm the motor, and gearbox size.
Clean up the mounting surface.

Remove the motor key if the diameter
of motor shaft is under $\varphi 35$.

Check motor shaft size and insert
bushing into input bore if necessary.

Remove the plug on the adapter plate.
Rotate the set collar till the bolt is line
up.

Put the motor into the gearbox vertically.

Tighten the mounting bolt in 1~4 order
with torque wrench.

Tighten the set collar bolt with torque
wrench.

Tighten back the screw plug.

1. To be sure to tighten motor first and
then to tighten the set collar on
motor shaft.

2. Please assembly in order according
to above steps, especially for step 6
and step 7.
